1. Real ICU cohort

Multicenter ICU trajectories with continuous physiological variables

Patient trajectories (hourly mapped)

Demographics and static features

2. Privacy-preserving tokenization

A. Binned + shuffled

Quantile tokens (per hour) with within-hour token shuffling

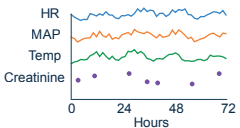

B. Binned, no shuffling

Quantile tokens (per hour) with fixed within-hour order

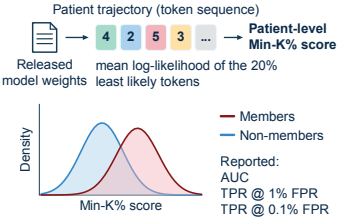

C. Continuous-feature baseline

Continuous multivariate time series (normalized values, hourly sampled)

3. Attacks on released weights

Attack A: Min-K% likelihood

Conditioning swaps

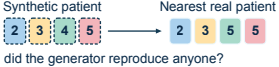

Detection floor

4. Attacks on synthetic cohorts

Attack B: replication

Attack C: membership from corpus

normalized edit distance | *pools matched per conditioning cell* | *within-hour order canonicalized*

Corruption floor

Plant altered copies in the synthetic corpus
